INTERGOVERNMENTAL PANEL ON climate change

CLIMATE CHANGE 2013

The Physical Science Basis

WG I

WORKING GROUP I CONTRIBUTION TO THE
FIFTH ASSESSMENT REPORT OF THE
INTERGOVERNMENTAL PANEL ON CLIMATE CHANGE

Observation

What has changed?

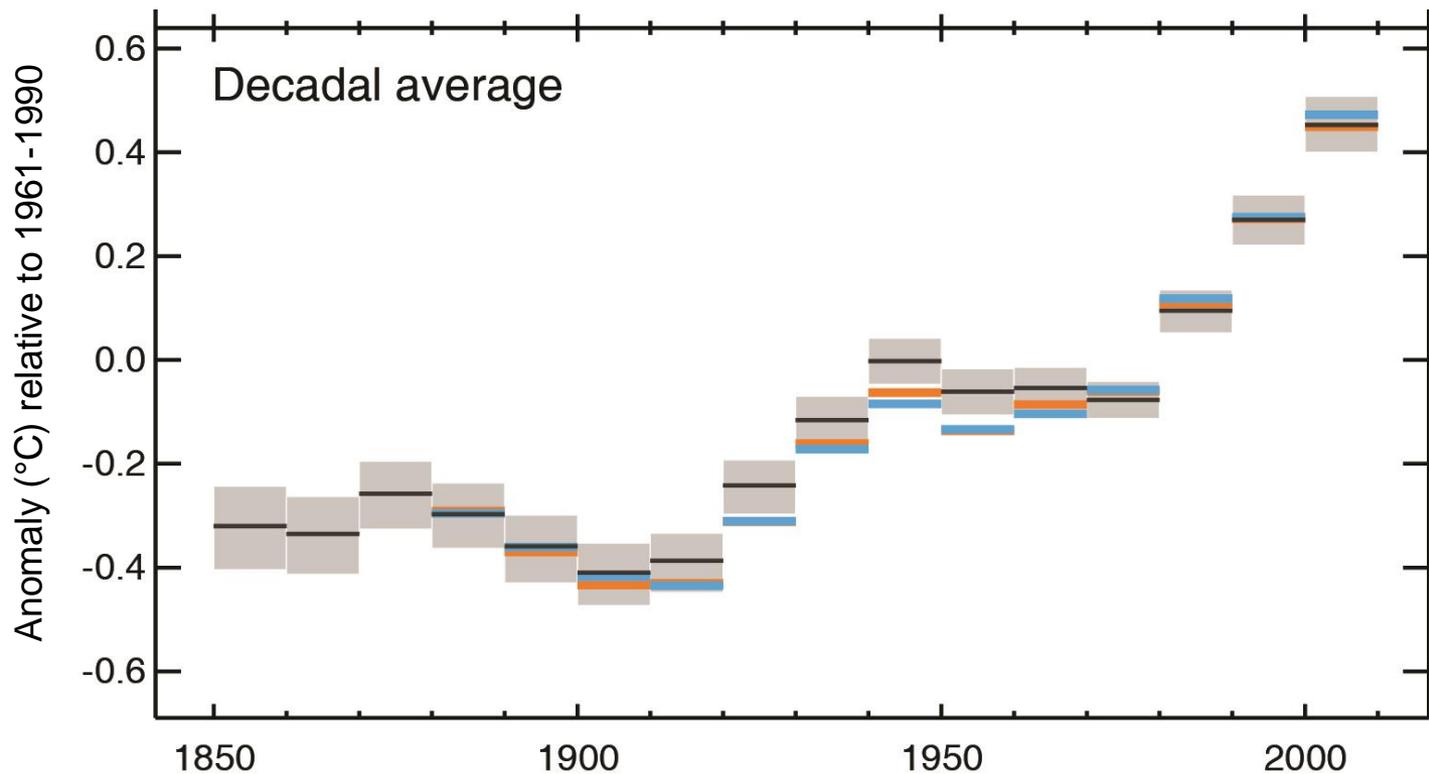

Fig. SPM.1a

Each of the last three decades has been successively warmer at the Earth's surface than any preceding decade since 1850.

In the Northern Hemisphere, 1983–2012 was *likely* the warmest 30-year period of the last 1400 years (*medium confidence*).

© IPCC 2013

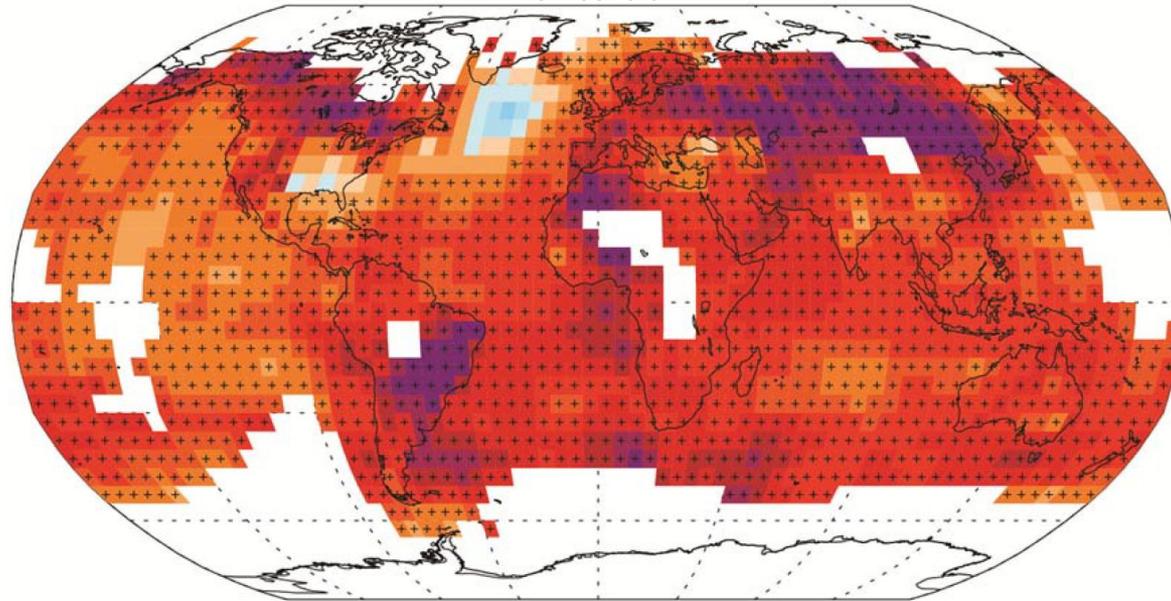

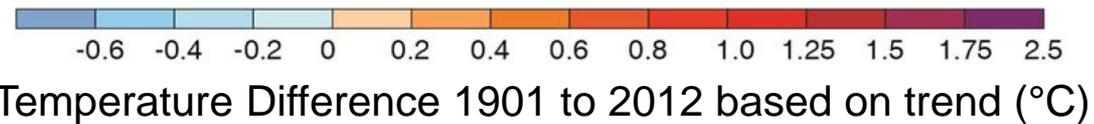

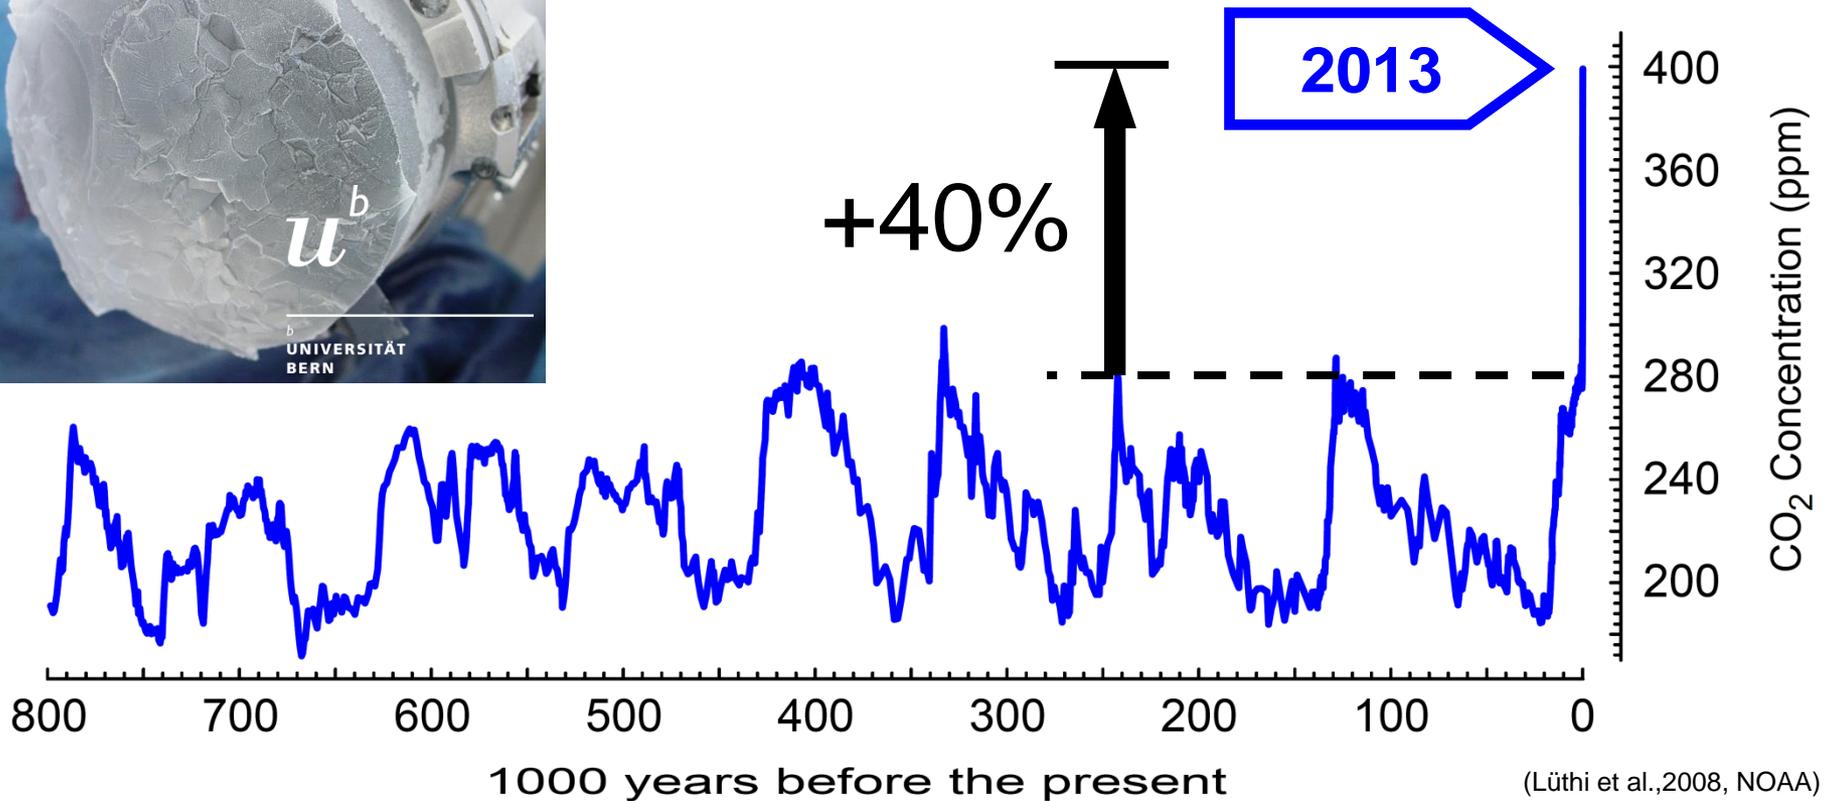

Fig. SPM.1b

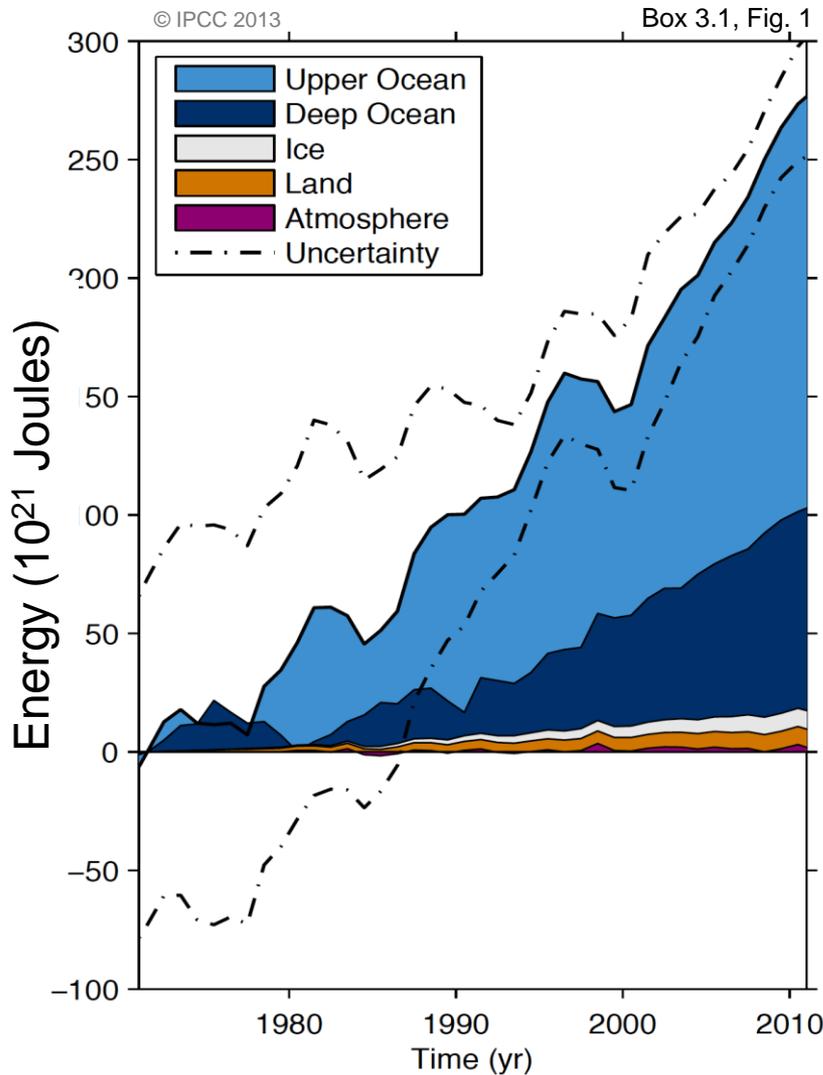

Temperature Difference 1901 to 2012 based on trend (°C)

Warming of the climate system is unequivocal, [...]

The atmospheric concentrations of carbon dioxide, methane, and nitrous oxide have increased to levels unprecedented in at least the last 800,000 years.

Ocean warming dominates the increase in energy stored in the climate system, accounting for more than 90% of the energy accumulated between 1971 and 2010 (*high confidence*).

Understanding

Why has it changed?

CO₂ provides largest RF

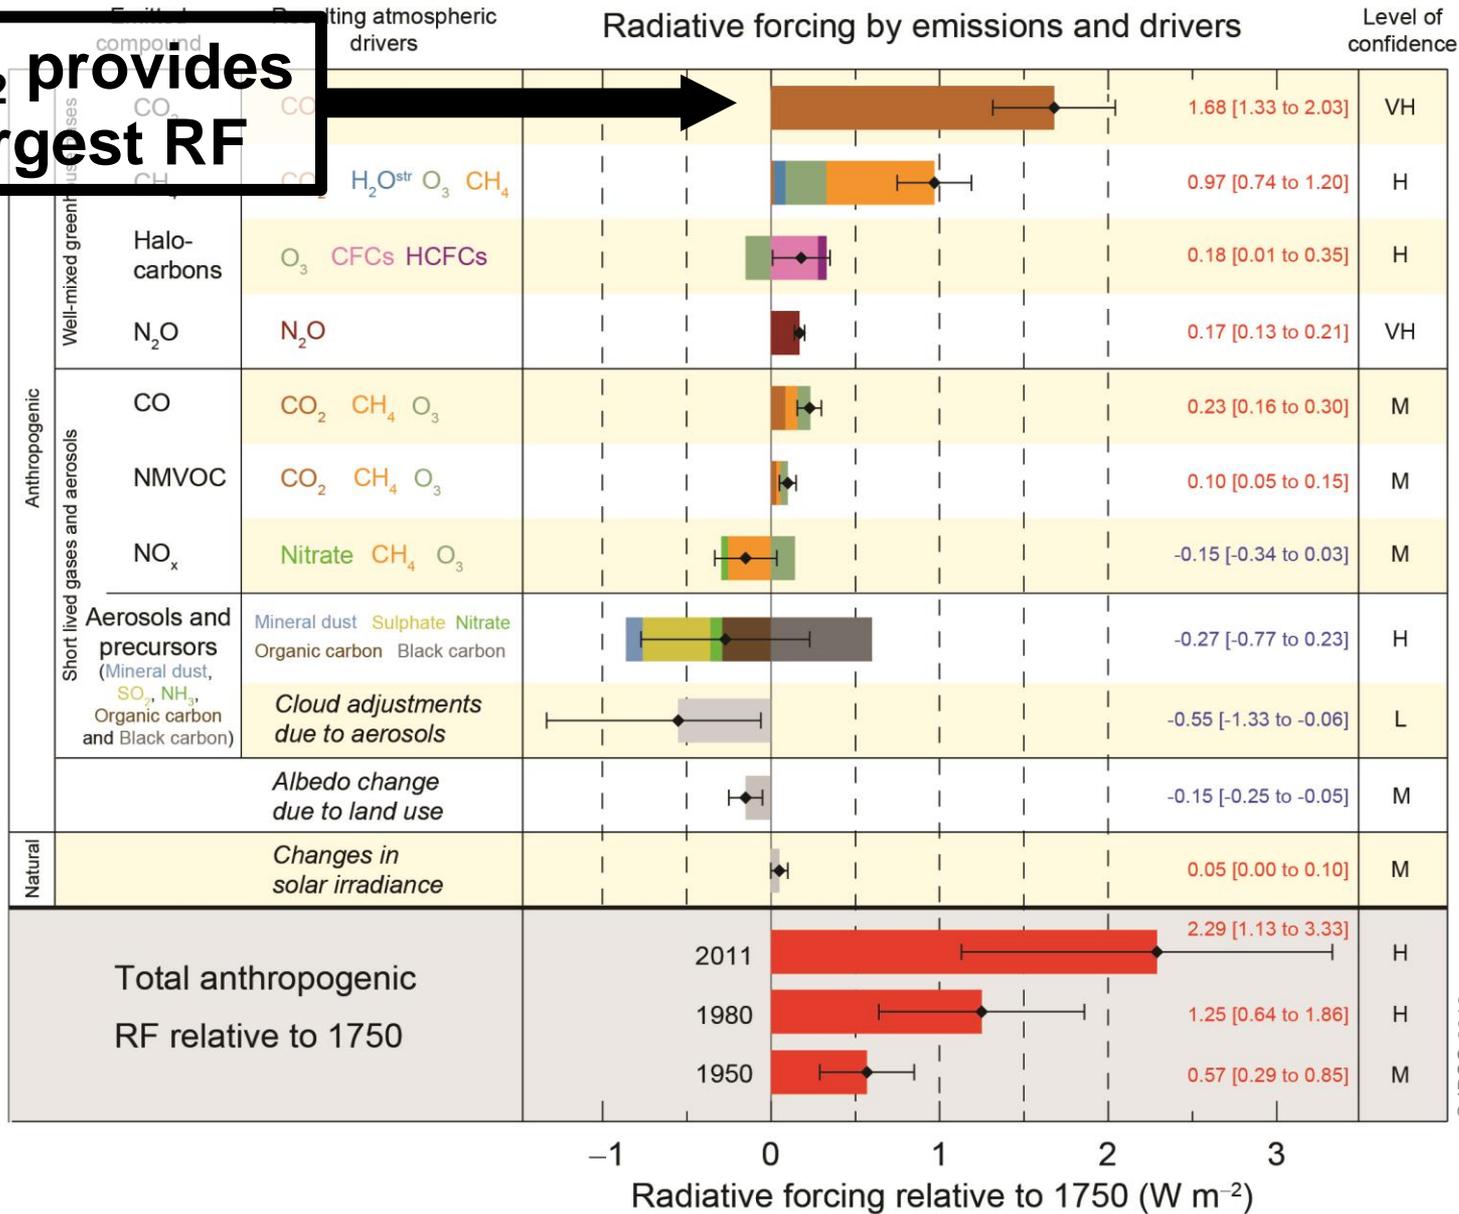

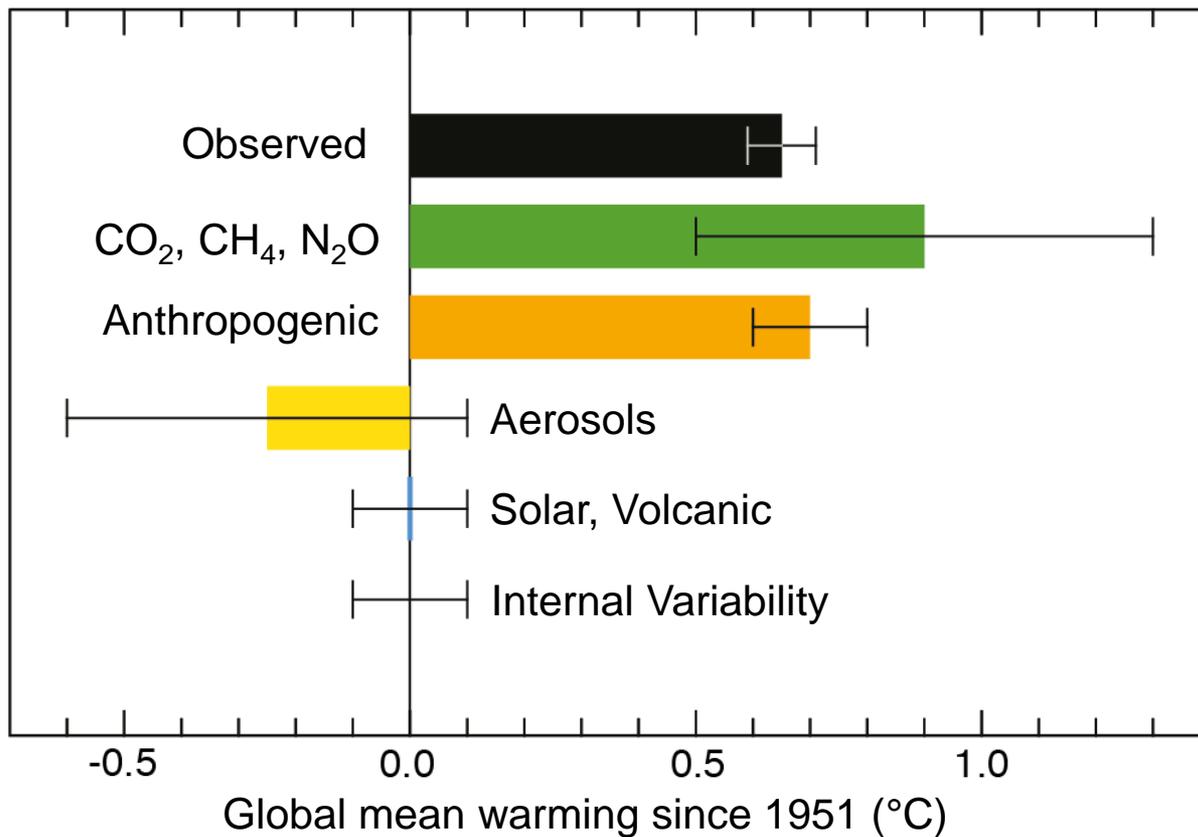

Fig. SPM.5

© IPCC 2013

© IPCC 2013

Fig. TS.10

Human influence on the climate system is clear.

Future

How will it change?

Global mean surface temperature change from 1986-2005

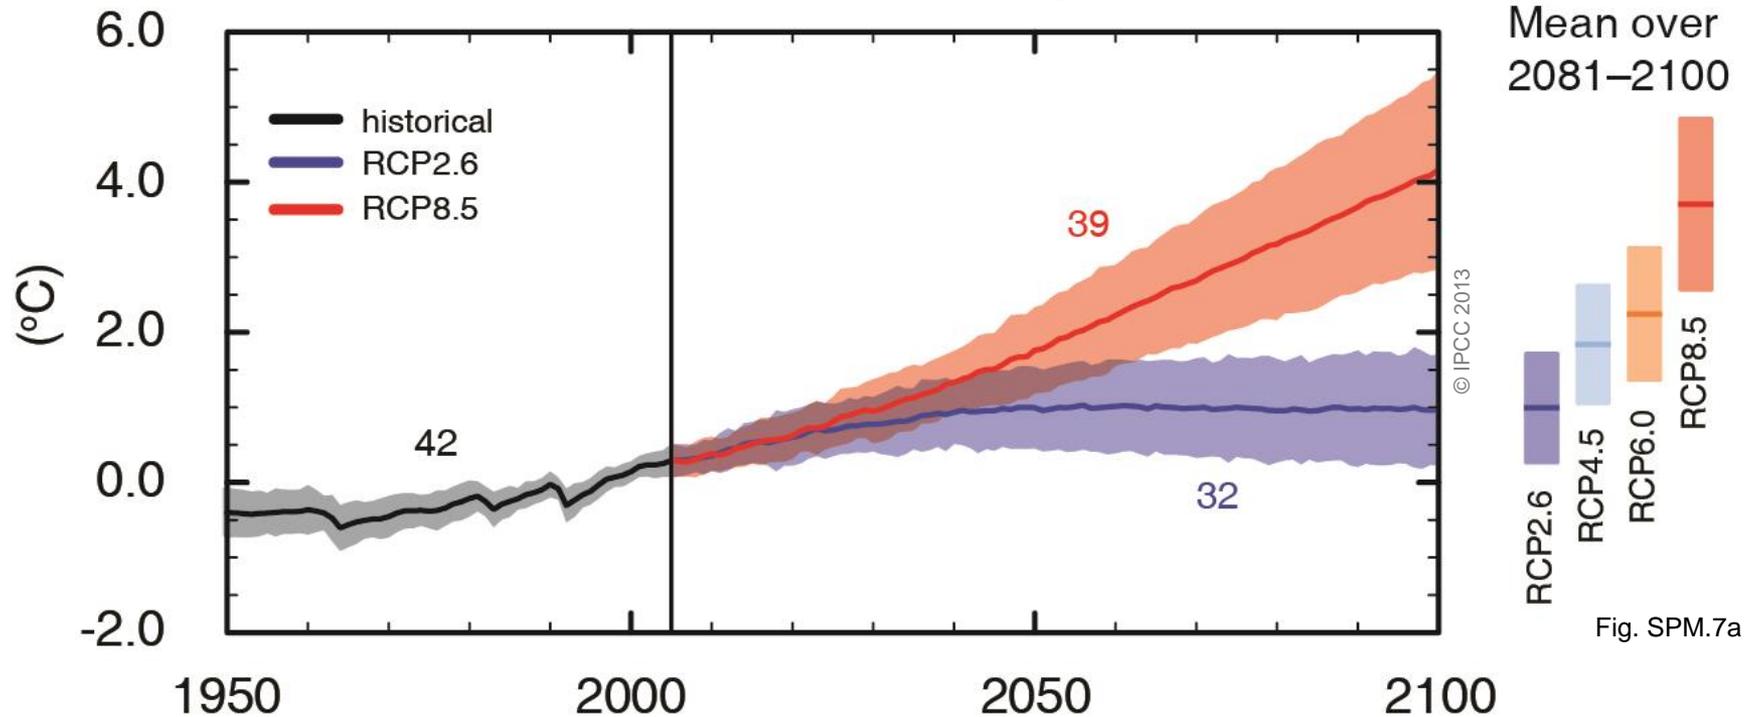

Fig. SPM.7a

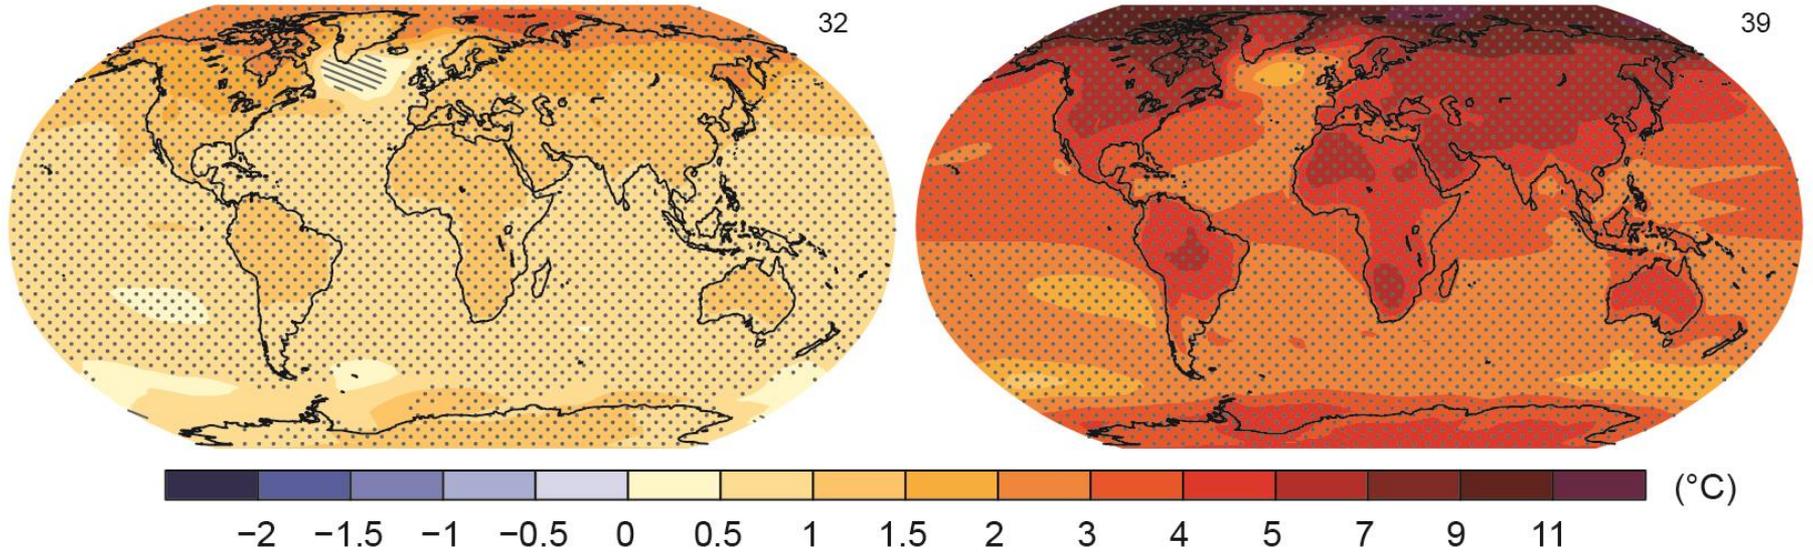

Global surface temperature change for the end of the 21st century is *likely* to exceed 1.5°C relative to 1850–1900 for all scenarios except RCP2.6.

RCP2.6

RCP8.5

Change in average surface temperature (1986–2005 to 2081–2100)

Fig. SPM.8

We have a choice.

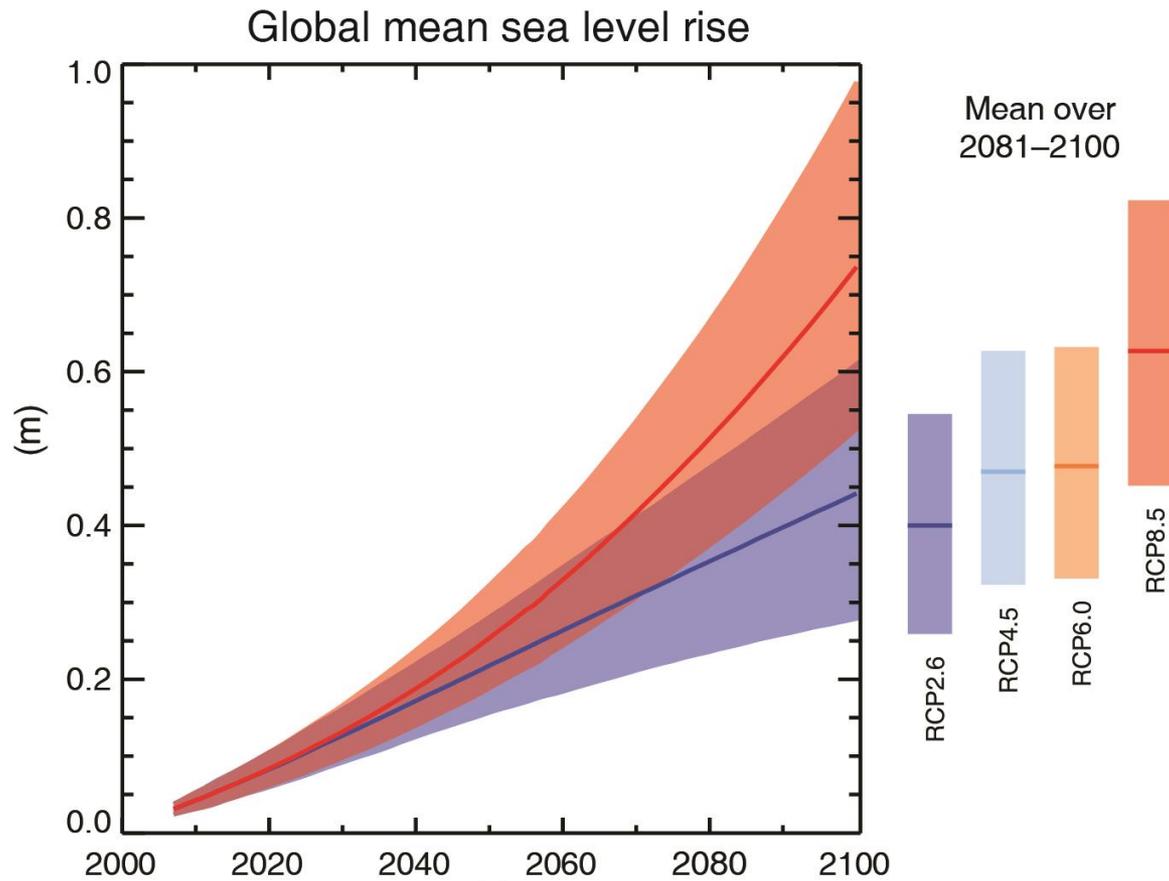

Fig. SPM.9

RCP2.6 (2081-2100), *likely* range: 26 to 55 cm

RCP8.5 (in 2100), *likely* range: 52 to 98 cm

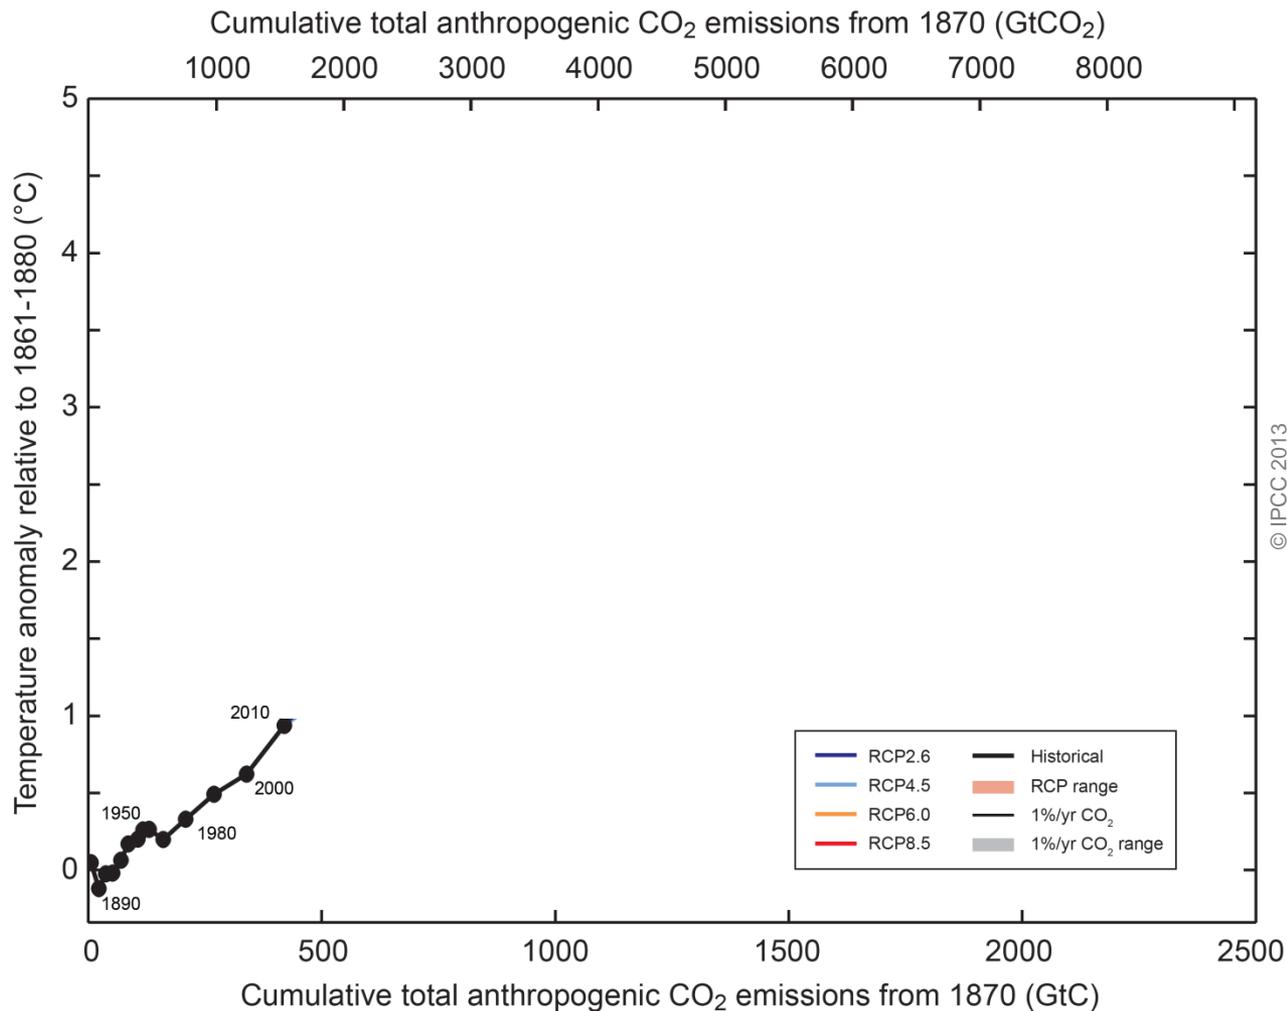

Fig. SPM.10

Cumulative emissions of CO₂ largely determine global mean surface warming by the late 21st century and beyond.

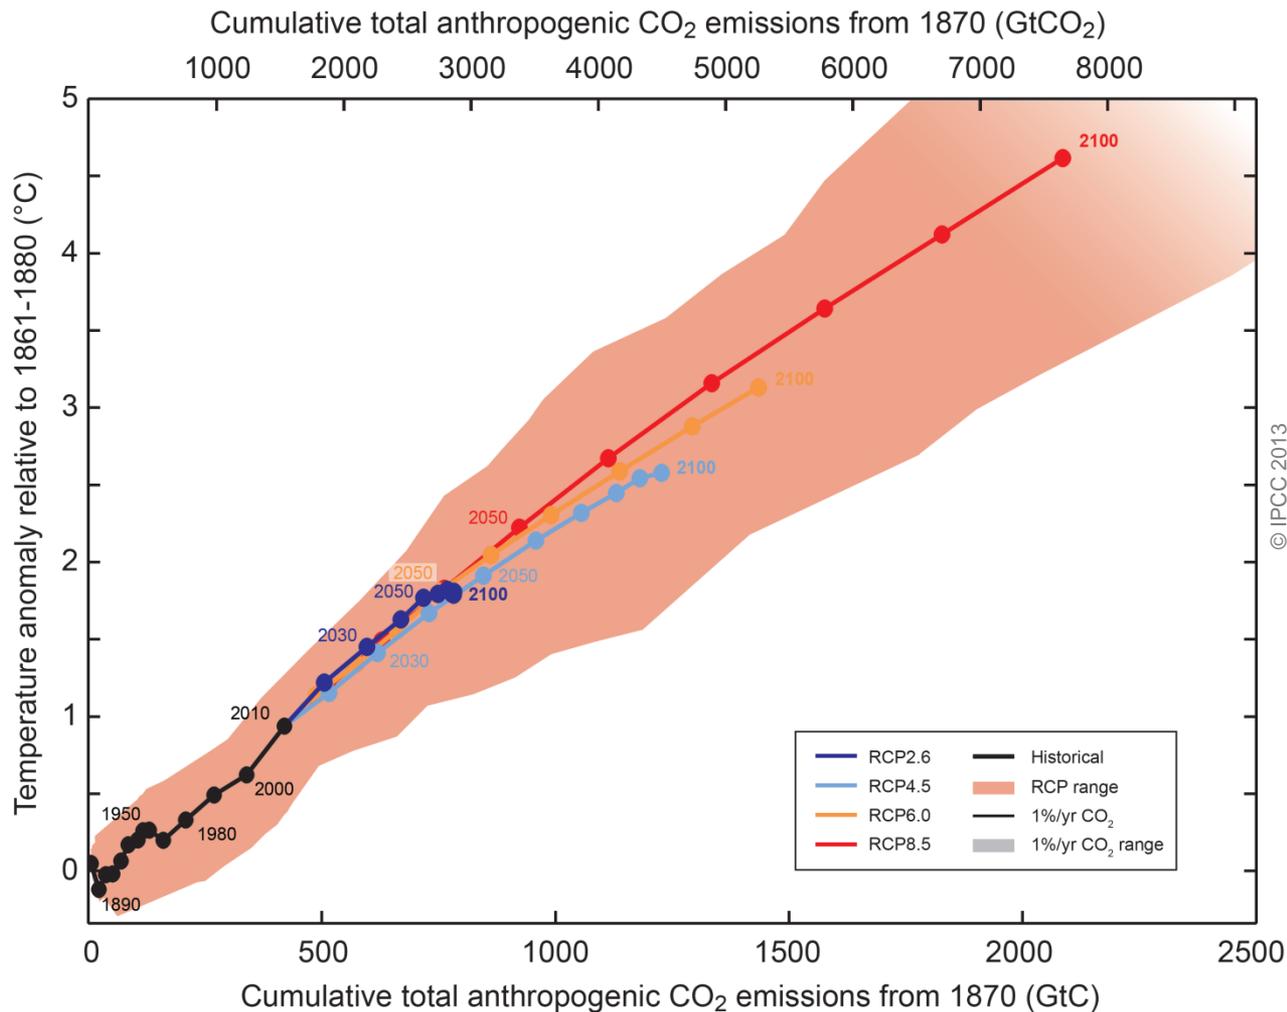

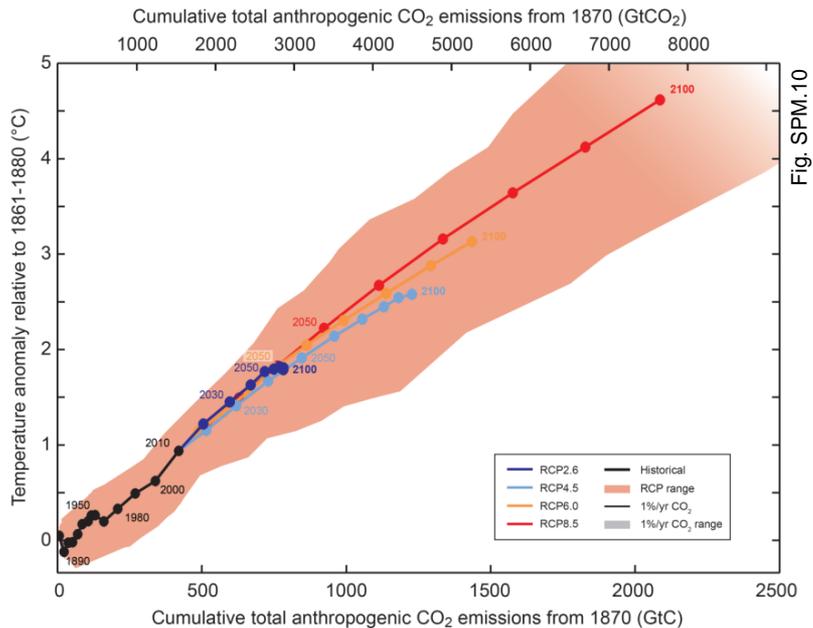

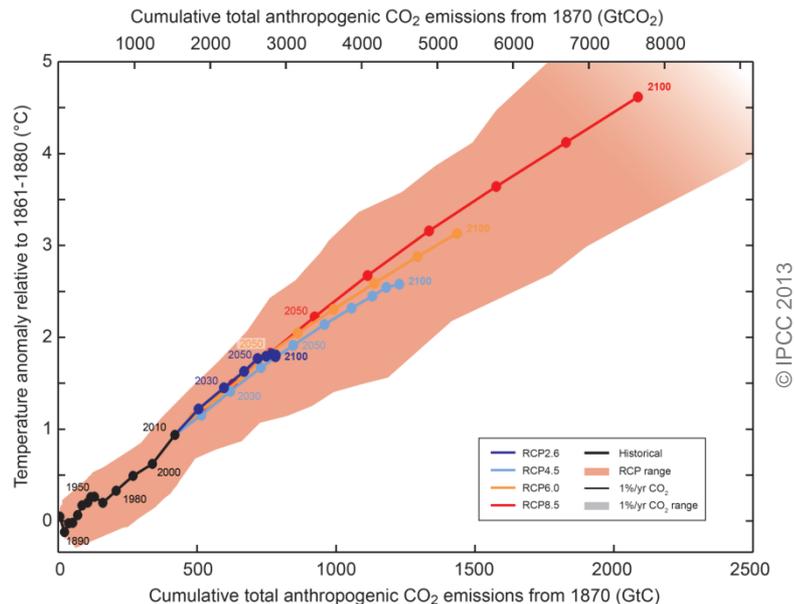

Fig. SPM.10

Limiting climate change will require substantial and sustained reductions of greenhouse gas emissions.

Limiting climate change will require substantial and sustained reductions of greenhouse gas emissions.

$\Delta T_{(1850-1900 \text{ to } 2100)}$	Likelihood	Scenarios
$> 1.5^{\circ}\text{C}$	<i>likely</i>	RCP4.5, RCP6.0, RCP8.5
$> 2^{\circ}\text{C}$	<i>likely</i>	RCP6.0, RCP8.5
$> 2^{\circ}\text{C}$	<i>more likely than not</i>	RCP4.5

Limiting warming to *likely* less than 2°C since 1861-1880 requires cumulative CO₂ emissions to stay below 1000 GtC. Until 2011, over 50% of this amount has been emitted.

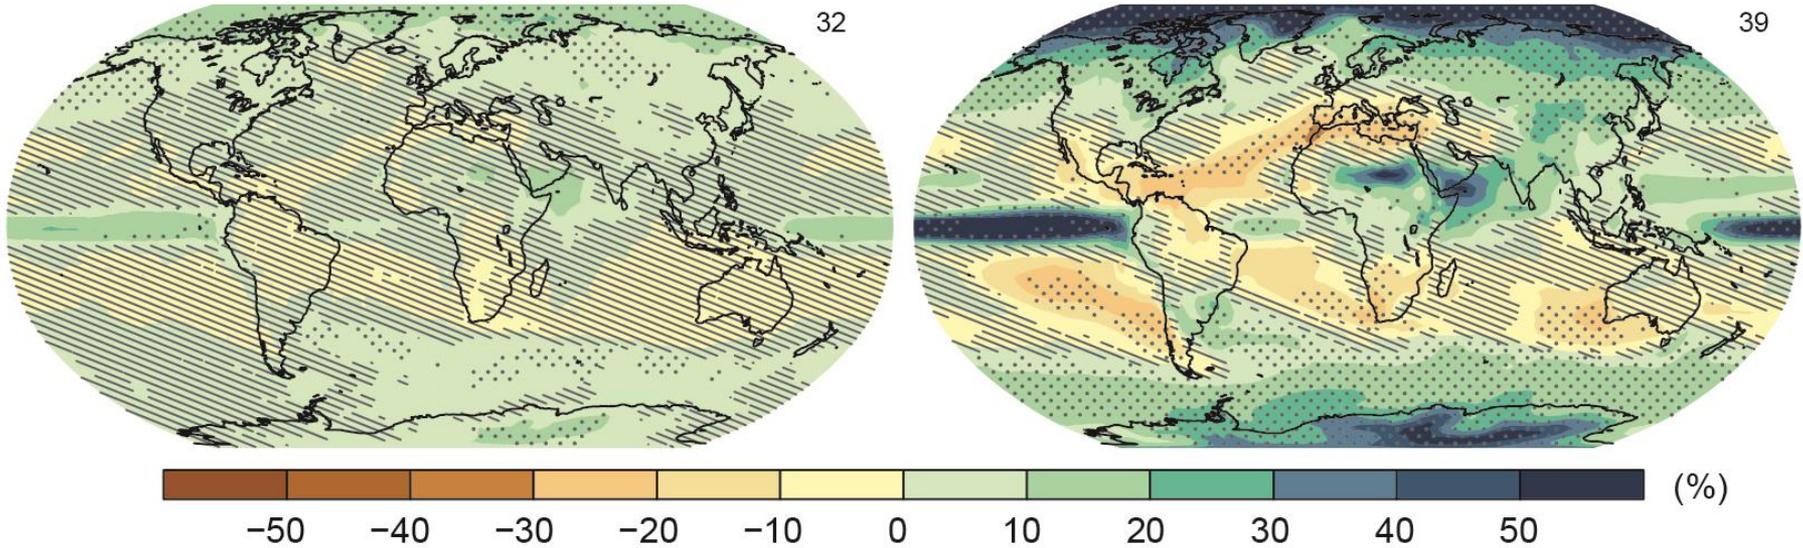

Accounting for other forcings, the upper amount of cumulative CO₂ emissions is 800 GtC; over 60% have been emitted by 2011.

RCP2.6

RCP8.5

Change in average precipitation (1986–2005 to 2081–2100)

Fig. SPM.8

We have a choice.
